Constructors

27 June 2026 10:22

Before starting constructors:

```
Student s1= new Student();
s1.age=10;
s1.name="Raj";
s1.marks=32;
```

Q **What if we need to create 100 student objects ?**
Do we need to assign every field separately every time ?

Note:

Syntax:

```
ClassName()
{

}
```

1. When we create any class, by default one constructor is there; it is called **constructor without parameter**
2. If we mention our **customized constructor** then JVM gives preference to it
3. If class has customized constructor and we want to use default constructor then we need to create it
4. Default constructor is used to initialize instance variable default value
5. If we want to give customized values to our instance variables while object creation, in this case we need **constructor with multiple parameters**
